Specialist Shrink Wrap Containment Solution

DAVID WATSON TRANSPORT

Shrink Wrap Containment for Fire-Damaged Printing Press

Alltask provided a specialist shrink wrap containment solution for David Watson Transport in Aylesford, Kent, enclosing a fire-damaged printing press within an industrial facility.

Following fire damage to the printing press, a shrink wrap screen was required to create a contained area around the affected equipment. The scale and location of the press required the enclosure to extend from floor level to the roof structure while working around the existing building services and operational areas.

Due to time constraints, the scaffolders worked 12-hour night shifts to ensure this element of the works was completed within the required timeframe.

The works also needed to be carefully coordinated, as the printing floor remained 100% operational and continued working 24/7 throughout the erection of the screen.

The Alltask team erected the shrink wrap screen around the printing press, creating a complete physical separation between the affected area and the surrounding workspace. The installation was carefully formed around the existing structure, including overhead steelwork and services, to provide extensive coverage around the damaged machinery.

The completed enclosure demonstrates Alltask's ability to provide adaptable shrink wrap and temporary containment solutions within challenging industrial environments.
